SVR-1 vs Gaddy & Klein on our 4 electrode sites: every result

Berkeley silent-speech test set (99 sentences), tested on sites 1, 2, 3, 6. Lower is better for errors, higher for picking the true sentence (chance 10%; 2% to 5% among 50). Best in bold.

		Words wrong (WER)		Letters wrong (CER)		True sentence picked among				
Model	**Trained on sites**	no LM	with LM	no LM	with LM	10 sentences	10 (closed set)	10 look-alikes	50 look-alikes	10 near-dups
Gaddy & Klein's released model	8	95.1%	94.2%	84.3%	87.7%	17.2%	17.2%	27.7%	5.3%	29.6%
Gaddy architecture, our retrain	8	88.8%	89.9%	63.9%	73.7%	35.4%	44.8%	36.2%	11.7%	45.9%
SVR-1 (ours)	4	78.1%	80.7%	41.2%	61.4%	**96.0%**	**84.0%**	**72.3%**	**40.4%**	92.9%
SVR-1 + articulator targets (ours)	4	**77.0%**	**69.3%**	**40.0%**	**49.0%**	94.9%	81.2%	63.8%	33.0%	**93.9%**

LM = Gaddy & Klein's 5-gram language model with their beam-search weights, tuned for their model and not refit for SVR-1 (it drops words from SVR-1's output, hence "with LM" can be worse than "no LM"). The Gaddy-architecture models were trained on all 8 sites; SVR-1 on these 4.
